

(Day – 6) Deployment Preparation and Staging Environment

(Market-Place E-Comemrce)

[1. Pushing Code to GitHub](#)

The first step was to push the updated project code to GitHub. This ensured that the latest changes were stored in a version-controlled repository, making it accessible for deployment.

[2. Deploying on Vercel](#)

After successfully pushing the code, the next step was deploying the project on Vercel. During deployment, some errors occurred, which were identified and resolved before proceeding further.

[3. Handling CORS Error in Sanity Studio](#)

Once the project was deployed on Vercel, an issue arose where the products were not displaying on the deployed link. Upon investigation, it was found that this was due to a CORS (Cross-Origin Resource Sharing) error. To resolve this, the deployed Vercel link was added to the CORS section in the Sanity Studio settings. After this update, the products successfully appeared on the deployed site.

[4. Managing Environment Variables](#)

To maintain security, all sensitive information such as API keys and project IDs were stored in the `.env.local` file. During deployment on Vercel, these environment

variables were also added in the Vercel dashboard to ensure the application functioned correctly in the production environment.

Conclusion

On **Day 6**, the focus was on deploying the project to a live environment while resolving deployment errors, configuring CORS settings in Sanity Studio, and securely handling environment variables. By the end of the process, the application was successfully deployed and fully functional on Vercel.
